

Eternit plates

Properties

Eternit roof tiles nowadays are made of fibre cement. The material consists of cement mixed with fibres, which makes the roofing sheets strong and light compared to other building materials.

Eternit roof tiles resist rot and fungus, but can become porous if they do not dry out regularly. Therefore, it is important to keep the roof free of moss and algae, which retain moisture.

Estimated life span of eternit roofing tiles is 15 years with regular maintenance.

Operation and maintenance

Operation

- Inspect the roof once per year
- Check for damage and make sure that nearby plants do not grow in between the plates
- Do not walk on the roof

Cleaning

- Remove dust, twigs, leaves and the like with a broom
- If necessary, wash the roof with an algae remover - follow the instructions on the product
- Rinse with clean water
